

ANUNCIO DE SEMINARIO

Coupling fluid permeation and large deformation in polymer gels

Dr Fernando Pereira Duda

Programa de Engenharia Mecanica and Programa de Engenharia da
Nanotecnologia Instituto Alberto Luiz Coimbra de Pos-Graduação e Pesquisa -
COPPE Universidade Federal do Rio de Janeiro - Rio de Janeiro, Brasil

Lugar de realización: Sala de Reuniones CIMEC

Fecha y hora: viernes 11 de marzo, 15:00 hs.

Resumen:

A polymer gel is a two-component material composed of an elastic cross-linked polymer network and a fluid that permeates the interstices of the network. Such materials exhibit unusual and complex phenomena as a result of the coupling between large deformation and fluid permeation.

In this talk, we present a continuum theory for the mutual interaction between large deformation and fluid permeation in polymer gels. The basic tenet here is the conceptual view of this body as a platform for two interdependent phenomena: a macroscopic (mechanical) phenomenon due to the deformation of the network and a microscopic (chemical) phenomenon due to the permeation of the fluid through the network.

Applications of the theory are provided within the context of volumetric phase transition, cavitation and pressure-driven fluid flow through a gel-filled channel.

El Dr Fernando Pereira Duda es Doctor por la Universidad Federal de Rio de Janeiro. Es actualmente Profesor Asociado del COPPE y Jefe de Departamento. Se encuentra en CIMEC realizando una estadía por un proyecto de colaboración con los Dres Alfredo Huespe y Pablo Sánchez.
